

ABSTRACT OF THE DISCLOSURE

A method for identifying a logic event in a logic environment, the method including providing one of a reference parameter and a next reference parameter, receiving starting event information corresponding to a logic event, ending event information corresponding to the logic event, and at least one identification parameter information associated with the logic event, determining an actual parameter corresponding to at least one of a duration parameter and a capacity parameter corresponding to the logic event, comparing the actual parameter to the reference parameter and providing a comparison result, and if the comparison result at least 5 indicates that the actual parameter is no less than the reference parameter, performing at least one of replacing the reference parameter with the actual parameter to provide the next reference parameter and providing the at least one identification parameter. 10
